FINAL- DuPont Response Update

On 17 November 2014, DuPont, the responsible party, completed the transfer the contents from the chemical process equipment and reduced excess pressure in the system. This activity was necessary due to a blockage in the vent lines that prevented excess pressure release from one of the process reactors. Once pressure readings are confirmed to be within normal range, response personnel will conduct additional air monitoring for methyl mercaptan and will make initial entry into the unit. Representatives of the Chemical Safety Board arrived at the facility. The response and investigation is on-going.
